

Vincent Martin

Software Architect · San Francisco, CA · hirevince@finalatomicbuster.net

SKILLS

Languages: Java, Kotlin, JavaScript, TypeScript, Rust, PHP

Frontend: React, Vite, GWT, PrimeFaces, Material UI, Tailwind

Backend: Quarkus, Jakarta EE, Spring Boot, JDBI

Databases: PostgreSQL, MySQL

Tools: GitHub Actions, BridgeLink/Mirth Connect, Flyway

Cloud: AWS (in progress)

AI Tools: OpenCode, Claude Code, Claude Opus (custom agents and skills)

EXPERIENCE

Software Architect, Deloitte (Formerly End Point Dev)

April 2023 to Present

- Modernizing EpiTrax from a Jakarta EE/PrimeFaces monolith to a React/TypeScript/Vite frontend with a Quarkus backend, using an agentic workflow in OpenCode with Claude Opus, including custom-built agents and skills, to accelerate development of the modernized platform.
- Maintain and extend EpiTrax, a Jakarta EE/PrimeFaces monolith, alongside supporting Java (Quarkus/JDBI) and PHP applications sharing a PostgreSQL database with Flyway-managed migrations.
- Designed and developed a proof-of-concept genomics visualization toolkit for disease outbreak tracking using React/TypeScript/Vite and Quarkus, helping win a new client contract and now leading the project into active development.
- Set up BridgeLink (an open-source Mirth Connect fork) to handle HL7/FHIR message routing between clinical systems, state health departments, and the CDC.
- Built and maintain CI/CD pipelines with GitHub Actions for multiple statewide client deployments.
- Own the technical roadmap, drive security improvements, and mentor a distributed team serving multiple state health departments.
- Support RFP responses by writing technical documentation, contributing to presentations, and performing gap analysis to identify and address missing capabilities.

BikeHopper (Open Source Contributor)

August 2022 to Present

- Converted GeoJSON route data from BikeHopper's routing API into Garmin-compatible .fit files for turn-by-turn navigation on cycling computers, including debugging and fixing a coordinate encoding issue.
- Upgraded the frontend from Tailwind CSS 3 to 4.

Senior Software Engineer, Tekmetric

June 2021 to August 2022

- Developed frontend features in React JS with Material UI for a heavily used SaaS application and contributed to a Spring Boot backend, providing peer code reviews throughout.
- Modernized legacy code by migrating styling to Tailwind and converting class components to functional ones with hooks.

Senior Software Engineer, FedNat

July 2015 to May 2021

- Built and maintained an agent portal in GWT for insurance agencies to manage claims, and contributed React components as the frontend modernized.

- Developed and maintained LOB, a Java/Kotlin claims processing system backed by MySQL.
- Wrote scripts to monitor message processing stats and track critical business workflows.
- Modernized builds (Ant to Gradle) and source control (SVN to GitLab) for easier team collaboration.

Network Security Analyst (IPv6 SME), Verizon/ICSA Labs

2006 to 2010

- Authored IPv6 Network Protection Device test specifications for U.S. Government NIST USGv6 program.
- Designed ICSA's internal IPv6 testing program and wrote software tools for evaluation.
- Tested network protection devices, worked with vendors to resolve violations, and published findings publicly.

Earlier roles include network engineering, security, and wireless systems for high-profile projects, including supporting press coverage during U.S. Presidential campaigns; details available upon request.
